## **I. Introduction**

The Air Toxics “Hot Spots” Information and Assessment Act (the “Hot Spots” Act) was initially adopted in September 1987 and has since been amended several times.

Section 44363 of the California Health and Safety Code requires local air districts to prepare and make available to the public an annual progress report on implementation of the “Hot Spots” Act. This report satisfies that requirement by summarizing emission inventory data, approved Health Risk Assessment (HRA) reports, public notification activities, and actions taken to reduce potential public health risks. The report may also be used by state and local health officials to prioritize the development and implementation of air toxic control measures to protect public health.

This document provides an overview of the “Hot Spots” Act program elements and the current status of implementation within the Antelope Valley Air Quality Management District (AVAQMD or District). It summarizes the results of locally prepared HRAs, the status of public notification requirements, and conclusions reached to date. The report is based on facility emissions data for calendar year 2024 or earlier and applies to the 2025 reporting year.

## **II. Air Toxics “Hot Spots” Program**

The primary objectives of the Air Toxics “Hot Spots” program are to:

1. Collect air toxics emission inventories from facilities subject to the program;
2. Evaluate whether those emissions result in localized impacts that may expose individuals or population groups to significant health risks;
3. Provide public notification to affected individuals or population groups when significant health risks are identified; and
4. Require facilities posing significant risks, or “High Priority”, to reduce those risks below applicable significance thresholds.

Since the adoption of the “Hot Spots” Act in 1987, multiple methodologies have been used to identify facilities subject to the program. These methodologies are described in the *Emission Inventory Criteria and Guidelines for the Air Toxics “Hot Spots” Program*. The guidelines were most recently amended on March 21, 2022, and are available on the California Air Resources Board (CARB) website.

Facilities subject to the program are required to prepare and submit air toxics emission inventories for District review and approval. Following approval of an emission inventory, District staff conducts a prioritization analysis to categorize each facility as having a high, intermediate, or low potential to pose a health risk. This prioritization is based on a calculated numerical score that considers the quantity of emissions, the toxic potency of the emitted compounds, and the proximity of emission sources to potential receptors.

In February 2015, the Office of Environmental Health Hazard Assessment (OEHHA) adopted updated risk assessment guidelines that districts are required to use when preparing “Hot Spots” health risk assessments. These revisions were implemented in response to the Children’s Environmental Health Protection Act of 1999 (Health and Safety Code §39606), which mandates explicit consideration of infants and children in evaluating air toxics risk. Under the updated OEHHA methodology, calculated cancer risks may be higher than under previous guidelines. As a result, additional facilities may be required to conduct health risk assessments, and in some cases, enhanced public notification and risk reduction measures may be triggered. Accordingly, the District updated its prioritization procedures to align with the revised OEHHA guidelines.

**a. Facility Prioritization & HRA Thresholds**

The District uses the table below to assign priority levels for facilities subject to AB2588 and HRA Thresholds.

	Prioritization Scores	
	Cancer Score	Non-Cancer Score
<b>High Priority</b>	≥10	≥10
<b>Intermediate Priority</b>	≥1 and <10	≥1 and <10
<b>Low Priority</b>	<1	<1
	HRA Thresholds	
	Maximum Individual Cancer Risk (MICR)	Hazard Index (HI)
<b>Significant Risk</b>	≥100 in a million	≥10
<b>Significant Health Risk</b>	≥10 in a million	≥1
<b>Moderate Risk</b>	>1 in a million	<1

[https://ww3.arb.ca.gov/ab2588/district\\_levels.htm](https://ww3.arb.ca.gov/ab2588/district_levels.htm)

Appendix A lists the facilities that are currently in the “Hot Spots” program and the current priority for each facility based on Prioritization Scores.

**High priority** facilities from prioritization scores are required to prepare a Health Risk Assessment (HRA) in accordance with methodologies developed by OEHHA. Each HRA is reviewed and approved by both District staff and OEHHA. Following review, facilities are reclassified into the appropriate priority category based on the HRA results.

**Intermediate priority** facilities from prioritization scores (Appendix A), or determined to present a moderate risk based on an approved HRA (Appendix B), are exempt from additional program requirements until the next reporting cycle. Appendices A and B identify the facilities currently subject to the “Hot Spots” program and specify each facility’s current priority classification, as determined by prioritization scoring or HRA

results.

For the AVAQMD, a **significant health risk** for purposes of public notification under the “Hot Spots” program is defined as:

- A lifetime excess cancer risk of greater than or equal to 10 in one million; or
- An acute or chronic noncancer total hazard index (HI) greater than or equal to 1.

A **significant risk**—which triggers both public notification and a concurrent risk reduction plan—is defined as:

- A lifetime excess cancer risk of greater than or equal to 100 in one million; or
- An acute or chronic noncancer total hazard index greater than or equal to 10.

When public notification is required, the District prepares a risk notification letter for distribution to affected residents and businesses. The facility may include its own supplemental letter in the notification package. Upon request from recipients, the District and the facility will conduct a public meeting to address community questions and concerns.

Facilities determined to pose a significant risk to nearby residents or workers must prepare and implement a Risk Reduction Plan to reduce health risks below the applicable significance thresholds. All facilities previously identified as posing a significant risk under the “Hot Spots” program have reduced their risks below the significant risk level. At present, AVAQMD has no facilities classified as posing a significant risk. Any facilities previously subject to significant risk determinations either ceased operations or modified operations such that, under current OEHHA risk assessment guidelines, they no longer exceed significance thresholds.

Finally, **low priority** facilities are conditionally exempt from further AB2588 program requirements.

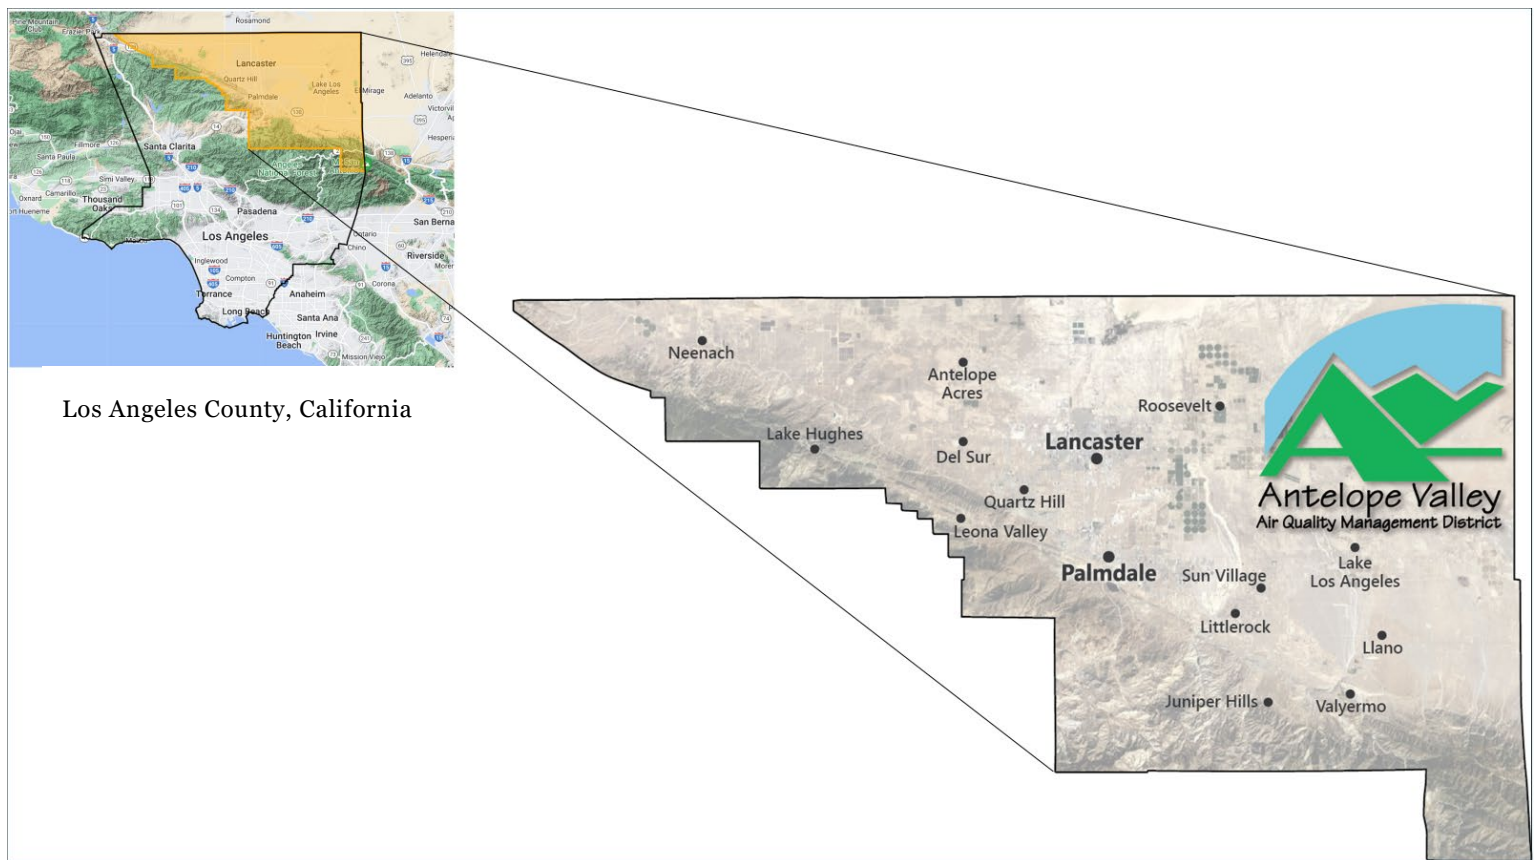

*This page was intentionally left blank.*

### III. Current Status of Toxic Emission Sources

The Antelope Valley Air Quality Management District (AVAQMD) is the agency responsible for regulating stationary sources of air pollution within the northern desert region of Los Angeles County (see Figure 1). The District’s jurisdiction extends from just south of Acton to the Kern County line to the north, from the San Bernardino County line to the east, and westward to the Quail Lake area.

AVAQMD is one of 35 air districts in California. Its jurisdiction spans approximately 1,300 square miles and includes nearly two dozen communities, including the incorporated cities of Lancaster and Palmdale. The District lies entirely within Los Angeles County’s Fifth Supervisorial District.

Figure 1: AVAQMD area of jurisdiction (Map Not to scale)

#### a. Industrywide Facilities

In addition to the procedures described above that apply to individual facilities, the District staff is responsible for analyzing the potential health risks posed by certain classes of smaller facilities that are called “industrywide” facilities. Facilities that are included in industrywide assessments by the District are autobody shops, retail gasoline stations, gasoline bulk plants, dry cleaners using perchloroethylene, and furniture strippers using methylene chloride. Industrywide facilities are prioritized the same as the District’s core facilities. The District has been prioritizing gasoline stations, gasoline bulk plants, and autobody shops using

statewide guidelines. These types of facilities may potentially pose significant health risks to the surrounding community.

### Perchloroethylene (Perc) Dry Cleaners

In 1991, the California Air Resources Board (ARB) identified Perchloroethylene (Perc) as a toxic air contaminant (TAC). As a result, many perchloroethylene (perc) dry cleaning facilities could pose significant risks; therefore, on October 14, 1993, ARB adopted ATCM for Emissions of Perchloroethylene from Dry Cleaning Operations to reduce emissions of perchloroethylene from dry cleaning facilities. In January 2007, the ATCM was amended to phase out the use of Perc dry cleaning machines and related equipment entirely by January 1, 2023. In 2018, the last Perc machine was removed. As a result, non-perc drycleaners are exempt from AB-2588 requirements – Appendix E of Emission Inventory Criteria and Guidelines.

### Gasoline Dispensing Facilities and Gasoline Bulk Plants

In 1997, CAPCOA (California Air Pollution Control Officers Association) developed Gasoline Service Station Industrywide Risk Assessment Guidelines to provide procedures for preparing gasoline station emissions inventories and risk assessments to meet the requirements of AB2588. However, as mentioned above, 2015 OEHHA guidelines typically result in higher cancer risks compared to using the old guidelines. In February 2022, the California Air Resources Board (ARB) published an updated Gasoline Service Station Industrywide Risk Assessment Guidance (Guidance). The Guidance provides an updated emission factor to the 1997 CAPCOA Gasoline Service Station Industrywide Risk Assessment Guidelines. The new Guidance also provides risk assessment screening tools (Look-up Tool and Variable Met Tool) using 2015 OEHHA guidelines for preparing gas station emission inventories and risk assessments to meet the requirements of individual facilities subject to AB2588. Additionally, AVAQMD Rule 461 requires gasoline stations to use Phase I and Phase II vapor recovery systems and requires that vent pipes on gasoline tanks be equipped with pressure/vacuum (P/V) vent valves.

The District utilized 2022 ARB's risk assessment screening tool to determine priority levels for 95 retail gas stations located in the AVAQMD during 2022. Based on screening results, all those facilities have been determined to be low or intermediate priority. The District did not find any high priority retail gas stations.

### Auto Body Shops

In 1996, CAPCOA also developed Auto Body Shop Industrywide Risk Assessment Guidelines to provide air districts guidance in preparing toxic emission inventories and health risk assessments. Again, based on the 1996 Auto Body Shop Industrywide Risk Assessment Guidelines and the District's 2022 Annual Report, auto body shops have been determined to be a low or intermediate priority. Because of the 2015 OEHHA guidelines, ARB and CAPCOA are also developing new risk assessment guidance to update the 1996 Auto Body Shop Guidelines. Once the guidance is finalized, the District plans to re-prioritize auto body shops.

One reason autobody shops and gasoline stations in the AVAQMD are less than high priority is due to existing District rules. AVAQMD Rule 1151 requires most automotive painting to be performed in a paint spray booth, requires high transfer efficiency coating application methods to be used, and prohibits the use of coatings containing lead or hexavalent chromium from being applied outside a spray booth. Under the California Air Resources Board Air Toxic Control Measure (ATCM) for Emissions of Hexavalent Chromium and Cadmium

from Motor Vehicle and Mobile Equipment Coatings, the use of coatings containing hexavalent chromium or cadmium for automotive painting has been prohibited as of December 31, 2003.

The industrywide guidelines documents and corresponding risk assessments will be updated as needed to implement the new OEHHA health risk assessment guidelines.

Appendix C is a list of industrywide facilities and indicates which facilities have been determined to have less than significant health risks.

#### **IV. Air Toxics Rules**

No specific rules to control emissions of air toxics have been adopted by the District based on the Air Toxics "Hot Spots" data.

ARB uses the Air Toxics "Hot Spots" data in developing air toxic control measures (ATCM) under the Toxic Air Contaminant Identification and Control Program. The US Environmental Protection Agency (US EPA) is also using the toxics emission data in developing Maximum Achievable Control Technology (MACT) standards under Title III of the 1990 Clean Air Act Amendments.

ARB adopted several ATCMs to control emissions of diesel engine exhaust particulate matter (DPM). Data gathered under the "Hot Spots" program was used in the development of the ATCM for stationary diesel engines, which was finalized on December 18, 2004. The Air Toxics "Hot Spots" Emission Inventory Criteria and Guidelines Report has been revised to include more diesel engines in the "Hot Spots" program. The additional diesel engines will be included in the "Hot Spots" program after the ATCM is fully implemented.

The District is required under state law to implement and enforce both state ATCMs and federal MACT standards.

#### **V. Conclusion**

Established in 1997, the District serves as the local regulatory agency responsible for controlling non-mobile sources of air pollution within the Antelope Valley. Its mandate is to balance environmental protection with the region's economic development by regulating emissions in a manner that safeguards public health while recognizing the economic contributions of local facilities.

To fulfill this responsibility, the District implements air toxics control measures designed to minimize public health risks. Facilities capable of emitting toxic air contaminants at levels that may pose significant health impacts are required to install and operate appropriate air pollution control equipment or adopt operational measures to reduce risk to acceptable levels. These acceptable levels are comparable to the range of risks encountered in routine daily activities.

Implementation of AB 2588 has strengthened public health protections in the Antelope Valley by requiring facilities to evaluate and mitigate potential health risks, with particular emphasis on protecting sensitive and vulnerable populations.
